

TOSIN OJO

PLATFORM ENGINEERING | CLOUD AUTOMATION | AI-ENABLED OPERATIONS
Indianapolis, IN | 317-721-3513 | tosinojoautomation@gmail.com | [Website](#) | [Linkedin](#) | [GitHub](#)

PROFILE

Hands-on platform and cloud engineering professional with 6+ years of experience designing, securing, automating, and operating environments across AWS, Azure, and GCP. Builds governed infrastructure-as-code, CI/CD, Kubernetes, serverless integration, observability, recovery, and self-service platform patterns using Terraform, GitHub Actions, Jenkins, Ansible, Docker, Python, Bash, and PowerShell. Applies generative AI, Claude, prompt engineering, guardrails, and agentic orchestration to improve platform capabilities while partnering across engineering, infrastructure, security, data, and vendor teams.

CORE TECHNICAL CAPABILITIES

Cloud Platforms: AWS, Azure, GCP, VPC/VNet networking, IAM and identity, Azure App Service, Azure Data Factory, Hybrid Integration Runtime, cloud cost and capacity analysis.

Platform & Containers: Kubernetes, Amazon EKS, Docker, Ansible, Terraform, Terraformer, CloudFormation, reusable modules, configuration management

CI/CD & Automation: GitHub, GitHub Actions, Jenkins, Git-based workflows, Python, Bash, PowerShell, AWS CLI, Azure CLI, validation, policy checks, approval gates

AI-Assisted Engineering: Amazon Bedrock, Claude, agentic workflows, prompt engineering, structured outputs, guardrails, evaluation workflows, human review

Data, Integration & Operations: Oracle, SQL Server, Redshift, API Gateway, Lambda, Step Functions, EventBridge, S3, SFTP, CloudWatch, New Relic, Grafana, Splunk, ELK

PROFESSIONAL EXPERIENCE

Enterprise Cloud Resource Manager | Ball State University | Jul 2023-Present

- I Standardized multi-cloud infrastructure delivery with reusable Terraform modules for networking, IAM, serverless services, storage, monitoring, tagging, and recovery, which helped to manual provisioning and configuration drift across AWS, Azure, and GCP.
- Moved infrastructure changes through protected branches, peer review, GitHub Actions validation and policy checks, Jenkins approval gates, environment checks, and smoke tests, which improves governance, release traceability, and deployment confidence.
- I Built a repeatable container platform with Docker, Kubernetes, Terraform, Ansible, GitHub Actions, Jenkins, probes, resource limits, ingress, secrets, and New Relic, which helps to reduce manual work and improves visibility from code commit through deployment.
- Wrapped Oracle and SQL Server procedures with controlled API Gateway and Lambda services using IAM, private networking, Secrets Manager, API keys, CORS, and resource policies. This helps to maintain application access without exposing databases directly.

- Replaced a Lambda-only AI batch process with Step Functions and EventBridge orchestration for a Bedrock/Claude workflow, reducing timeout risk, improving failure isolation, which helps in preventing duplicate processing, and making results more auditable.
- Traced Azure Data Factory-to-Oracle timeouts across Hybrid Integration Runtime, on-premises connectivity, firewalls, credentials, and database paths, narrowing the failure to the correct layer and giving resolver teams a clearer path to recovery.
- I applied generative AI to code scaffolding, troubleshooting, documentation, testing, research, and junior-engineer knowledge transfer with human review, which helps to accelerate engineering analysis while preserving responsible oversight.

Cloud Architect | GoCloud Architect | Apr 2022-Jul 2023

- I Addressed fragmented access-management requirements by implementing federated identity solutions across Microsoft Active Directory, AWS, and Azure, providing more consistent and secure access to cloud resources.
- Designed strict availability requirements by designing resilient systems with redundancy and fault-tolerance controls, achieving 99.999% availability for customer environments.
- Introduced Terraform governance, CI/CD standards, DevSecOps controls, Git-based deployments, event-driven patterns, and automation, making infrastructure changes more repeatable, controlled, and supportable.
- Modernized enterprise server environments by designing and deploying VMware infrastructure, improving resource utilization, scalability, and centralized management through virtualization.

AWS Cloud Engineer | Savycon Technologies | May 2019-Apr 2022

- I deployed highly available AWS application platforms with VPCs, private/public subnets, Auto Scaling, load balancing, EC2, RDS, KMS, and secure network segmentation, creating a more resilient and scalable foundation for hosted workloads.
- Delivered AWS migration and modernization initiatives with CloudFormation, EC2, S3, RDS, DynamoDB, and repeatable environment builds, which help gives web and business applications a scalable, automated cloud foundation.
- Implemented VPC segmentation, NACLs, security groups, IAM, KMS, Auto Scaling, load balancing, CloudWatch, CloudTrail, AWS Config, and SNS, which strengthened least-privilege security, availability, monitoring, and recovery readiness.

CERTIFICATIONS, EDUCATION & SERVICE

AWS Certified Solutions Architect - Professional (2025)

AWS Certified Solutions Architect - Associate (2021)

Bachelor of Technology, Meteorology | Federal University of Technology, Akure, Nigeria (2014)

U.S. Army Reserve
